8 General rules

Range of application

This machine may only be used for cleaning facades, vehicles, containers, pavement slabs, stables, machines and similar objects.

Inspections

The machine must be inspected according to the “Guidelines for Liquid Spray Devices” at least once every 12 months by a qualified person, to ensure that continued safe operation is guaranteed. The results of the inspection are to be recorded in writing. This may be done in any form. For inspection reports see pages 48/49.

High-pressure cleaners used for commercial purposes have to be checked by a qualified person at least every 12 months!

Accident prevention

The machine is designed for accidents to be impossible (if used according to these instructions). Please read safety notes included in these instructions carefully before using the machine and act correspondingly. Operating staff has to be instructed according to this manual. The “Guidelines for Liquid Spray Devices” must be complied with.

Setting up - Location

Neither set up and operate the machine in rooms where there is a risk of fire or explosion nor put it into puddles. It is prohibited to use the machine under water.

Safety notes

Do not jam the trigger of the gun during operation!

When carrying through service and maintenance tasks the machine has to be cut off the power supply system. Put main switch to "0" and pull plug out of socket.

Never operate the machine if cables or other safety-relevant parts (e.g. excess pressure valve, high-pressure hose, spraying devices, etc.) are defective.

Safety notes

Never operate the machine without supervision. The machine may only be operated by persons who have been instructed accordingly.

Some parts inside the machine, all water conducting components and all metal parts of gun and lance are hot during hot water operation. Keep all hoods and protective covers closed during operation and never touch any metal parts of gun or lance.

Persons operating the machine should wear the necessary protective clothing, i.e. waterproof clothing, rubber boots, safety goggles, headwear etc. It is prohibited to use the machine in close vicinity to people lacking suitable protective clothing.

The high pressure spray can generate a high level of noise. If noise exceeds the maximum allowed levels, users and others in the vicinity must wear suitable ear protection.

Do not spray against matter containing asbestos or other hazardous substances.

For safety reasons always switch the main switch to "0"- position after having finished the cleaning task (disconnection from power supply).

Bear in mind that during cleaning tasks with a high-pressure water jet a significant recoil at the lance arises. Additionally angled lances produce a clearly perceivable amount of torque.

Apply the safety catch on the spray gun after each use, in order to prevent unintentional spraying!

Always aim the underbody lance! Bear in mind when using a curved or angled spraying lance that there is a significant amount of torque in the recoil!

10 Safety notes - This is prohibited!

Never direct the water jet at people or animals!

Only use power cables which are in perfect working order! Do not damage the power cable or repair it incorrectly!

**Never pull the high pressure hose if it has formed kinks or "nooses"!
Never pull the hose over sharp edges!**

Never allow children to use the high pressure cleaner!

Never direct the water jet at the machine itself!

The machine may not be placed within reach of the water jet spray mist!

Never direct the water jet at a power socket!

■ Connection to water supply

Please pay attention to the regulations of your waterworks company! In accordance with DIN EN 61770, the machine may not be directly connected to the public drinking water supply lines. A brief connection however is permissible according to DVGW (German Association for Gas and Water Affairs) if a tube ventilator with check valve (Kränzle Order-No. 41.016 4) is built into the water supply. Also indirect connection to the public drinking water supply lines is permissible by way of free emission in accordance with EN 61 770; e.g. by using a reservoir with a float valve. Direct connection to a non-drinking water supply line is permissible.

■ Electrical connection

The voltage given on the specification plate must match the mains voltage.

The machine is supplied with power cable without plug. The plug has to be equipped with a safety earth terminal and a 30 mA residual-current circuit breaker. The mains connection has to be fused with a time-delay fuse according to the specifications on page 6/7.

If an extension cable is used, it must have an earth line that is properly connected to the plug connections. The conductors in the extension cable must have the following minimum cross section:

at 18 kW - 6 mm²

at 24 kW - 10 mm²

at 36 kW - 16 mm²

at 48 kW - 25 mm²

Extension cables that are too long cause a drop in voltage and thus malfunctions. If you are using a cable drum, the cable must always be fully unwound.

12 Putting into operation

1. Connect to power circuit. **Make sure that the main switch is in "OFF" position.**
2. Connect machine to water mains (2 - 8 bar pre-pressure). Inside diameter of hose minimum 1/2 ". The water storage tank fills with water. The float valve shuts the water intake as soon as the tank is full.
3. Fasten high-pressure hose to appliance

4. Push on HP hose to gun.
5. Screw together HP hose and gun pressure-tightly.

Take care that all screw connections are pressure-tight. A leakage of gun, high-pressure hose or hose drum has to be repaired at once. Leakages lead to an increased wear and guarantee is void if consequential damages occur.

6. **Always check oil level prior to operation!** Open the HP cleaner. Do not start the machine if the oil level is not between the two markings on the oil-level glass. Refill with oil if necessary. See page 23.

■ Usage as a cold water high-pressure cleaner

1. Ignition switch to **-OFF-** position

Detergent valve must be closed!
(Switch in left end stop position)

2. Switch on main switch with disengaged spray gun. Vent high-pressure cleaner: Pull and release trigger of spray gun various times.

Start cleaning task.

■ Usage as a hot water high pressure cleaner

1. a) Temperature mode: Set required temperature at the thermostat.
(Min. temperature 40 °C)
b) Percentage mode: Set percentage value for heating output.

2. Switch on main switch with disengaged spray gun. Vent high-pressure cleaner: Pull and release trigger of spray gun various times.

Detergent valve must be closed!
(Switch in left end stop position)

3. Start ignition. The water is heated up and constantly kept at the set temperature.

Start cleaning task.

14 Kränzle technology

■ Water and cleaning system

The water is fed to the high-pressure cleaner under pressure (2-8 bar pre-pressure). A float valve regulates the water flow in the storage tank. Then the water is sucked directly from the storage tank by the high-pressure pump and forced with the adjusted pressure through the heat exchanger to the safety spray lance. The high pressure jet is formed by the nozzle at the end of the safety lance.

Environmental, refuse disposal and water protection regulations must be observed!

■ Lance with trigger gun

The machine can only be operated when the safety trigger is squeezed. When the lever is squeezed, the spray gun opens. The liquid is then pumped to the nozzle. The spray pressure increases and quickly reaches the selected operating pressure. When the trigger is released, the trigger gun closes and any further spraying of liquid from the lance is stopped. The motor stops.

When actuating the gun once more the pressure control valve - safety valve closes and the motor is started again. The pump resumes feeding water to the spraying lance with the selected operating pressure. When the gun is closed, the water hammer opens the pressure control valve - safety valve and the motor is switched off by the pressure switch.

The trigger gun is a safety device. Repairs should only be performed by qualified persons. Should replacement parts be required, use only components authorized by the manufacturer.

■ Total stop system

The machine is fitted with a Total-Stop-System. If the gun is closed for longer than approx. 20 seconds, the machine switches off automatically, after 20 minutes the machine moves to safety switch off and you must use the main switch to turn it back on. The machine restarts automatically when the gun is operated, provided that the master switch is on.

■ High pressure hose and spraying device

The high pressure hose and spraying device supplied with the machine are made of high grade material, they are also optimized for the machine and marked as required by the appropriate regulations.

If replacement parts are required, only such parts that are authorized by the manufacturer and which bear the markings required by the appropriate regulations may be used.

The high pressure hose and spray device must be connected in a pressure-tight manner.

The high pressure hose may not be driven over, pulled excessively, or twisted. The hose may under no circumstances be pulled over sharp edges, since otherwise the guarantee is automatically void.

Hoses are wearing parts. The guarantee only covers defects of fabrication no external damages whatsoever.

Defective high-pressure hoses and spraying devices may not be repaired. They always have to be replaced.

■ Pressure control valve-safety valve

The pressure control valve allows full adjustment of water quantity and pressure. The safety valve protects the machine from excessive pressure and cannot be adjusted beyond the admissible operating pressure. The setting nuts are sealed with lacquer.

Replacements, repairs, new adjustments and sealing operations may only be performed by trained personnel.

■ Adjustment of pressure, quantity and temperature

The operating pressure, the water flow and correspondingly the water temperature is controlled by the pressure control valve.

A right-hand turn increases the pressure, a left-hand turn decreases the pressure.

16 Kränzle technology

Thermostat

The thermostat controls the spray water temperature.

After you switch on the device, "888" appears in both displays for approx. 1 second as a test of the functioning of the displays.

The thermostat has two operating modes:

1. Temperature mode

This mode is always activated when the unit is switched on or can be selected using the "°C" button (Pos. 3). The red LED above the "°C" button and next to the set temperature display lights up. The desired "Set" temperature is set using the two buttons (+/-, Pos. 5+6) and can be read in the upper display (Pos. 1). If you press the button for a longer time, the set temperature is quickly adjusted in 5°C increments.

The last set value set is also stored after the unit is switched off and is available again immediately after switching back on.

The current spray temperature can be read from the bottom display (Pos. 2).

2. Percentage mode

This mode is activated by pressing the "%" button (Pos. 4). The yellow LED above the "%" button and next to the set temperature display flashes.

In the temperature control system in conventional high pressure cleaners, and in **temperature mode** for this unit, the water temperature is measured at the outlet of the heater, and the heater is switched on an off according to the temperature desired by the user. Due to the large amount of water in the heating coil, it takes a long time until the temperature sensor registers that the burner has switched on and the desired temperature has been reached. This means that the temperature increases far above the desired value or falls far below the desired value.

Thermostat - Percentage mode

The innovative new **percentage mode** now lets the user specify the switching duration of the heater in percent using the "+" and "-" buttons (Pos. 5+6) (100% being the max. temperature) rather than setting the desired temperature. Now the result of the setting must be checked by using the "Actual" temperature display. If the desired temperature has not yet been reached, the percentage must be increased.

By setting percentages of the heating duration, the temperature of the high pressure jet is kept constant in a very narrow range.

The last value set is also saved after the unit is switched off in percent mode.

Operating hour meter

The cleaner is equipped with an operating hour meter.

If during normal operation the momentary operating mode button ("°C" or "%") is actuated for more than 2 seconds, the operating time of the pump is displayed for 5 seconds and afterwards the combustion time for 5 seconds as well. Thereafter the display shows the original values again.

As long as the operating hours are displayed no further inputs on the monitor are possible.

The operating time is displayed in hours [h] either in the "TARGET" or in the „ACTUAL“ window. The 1000 and 100 hours are displayed in the „TARGET“ window and the 10, 1 and 1/10 hours in the "ACTUAL" window:

Pump operating time: Target-Display: P 9 9 Actual-Display: 9 9. 9 for 9 999.9h

Combustion time: Target-Display: F 9 9 Actual-Display: 9 9. 9 for 9 999.9h

e.g.: F00 27.3 = Combustion time 27 hours and 18 minutes

Displayed malfunctions

Display as follows		Cause	Action
SOLL	IST		
Err	OFF	Water temperature at heating chamber outlet above 147 °C	Operate appliance without heating „Heating OFF“ until the temperature has dropped below 147°C. Switch main switch „OFF“ and then back „ON“ again
AUS (OFF)	E7	Appliance has not been operated for more than 20 minutes -> Safety cut-off	Switch main switch „OFF“ and then back „ON“ again.
Err	E2	Temperature sensor defective	Replace temperature sensor

18 Kränzle technology

■ Electric heating 18, 24, 36, 48 kW

The flow heaters are connected in series in modular design according to machine type and kW output.

For water temperature at max. water output we refer to the table on pages 6/7, second column „Heating of sucked in water“.

To be able to reach the maximum hot water output temperature it might be necessary to reduce the operating pressure, thus reducing the water output in l/min at the same time (see page 15).

For the temperature values we refer once more to the table on page 6/7, see „max. hot water output“.

Flow heater

Suction of detergents

■ Detergent supply from the suction side:

Detergent injection on the pressur side, as you probably know it from other HP cleaners, consume approx. 30 % of the cleaning energy, no matter if they are used or not. Due to the water tank fitted to the Kränzle therm cleaners it is now possible to directly suck the detergent into the pump thus reducing output loss and increasing the efficiency considerably.

The detergents are applied without having to reduce the working pressure.

- 1.** Place detergent filter into detergent container.
- 2.** Dosing of detergent is done by turning the detergent valve.
- 3.** By closing the detergent valve the supply of detergent is stopped.
- 4.** After having used detergents rinse the appliance with open spray gun and clean water for at least 2 minutes.

Only open the dosing valve, if the detergent sieve is placed in a liquid. Sucked air leads to destruction of the pump seals! No guarantee!

**Keep detergent-ph-value neutral 7 - 9!
Observe specifications of detergent manufacturer!
e.g.: protective equipment, rules for waste water treatment etc.**

Never suck in liquids containing solvents like varnish solvents, petrol, oil or similar liquid! Observe specifications of detergent manufacturers!

Seals inside the appliance are no resistant against solvents! The spray mist of solvents is highly inflammable, explosive and poisonous.

Decommissioning - frost protection

1. Switch off the machine - main switch to „0“- position
2. Cut off the water supply
3. Open the spray gun briefly until the pressure is released
4. Apply the safety catch on the spray gun
5. Remove the water hose and spray gun
6. Drain the pump: switch on the motor for approx. 20 seconds
7. Pull the plug from the socket
8. Clean HP hose and stow away
9. Clean water filter

■ Frost protection

The machine is normally still partially filled with water after work has been completed.

In case the high-pressure cleaner is exposed to frost:

To protect the appliance from frost, completely empty it of water:

Disconnect the machine from the water supply and switch off the ignition. Switch on the master switch and open the gun. The pump now presses the remaining water out of the water tank, the pump and the continuous-flow heater.

Do not allow the machine to run for longer than a minute without water.

If the machine is not in use for lengthy frosty periods of time, it is advisable to pump anti-freeze into the machine: For this purpose, fill the antifreeze agent into the water tank and switch on the machine without ignition. Wait with opened gun, until the agent comes from the nozzle.

However, the best protection against frost is to keep the machine in a place that is safe from frost.

Care and Maintenance

The machine must be disconnected from the power supply when servicing work is being carried out. The main switch should be in position "0" and the plug out of the socket.

■ Weekly, or after approx. 40 hours of operation:

- Check the oil level of the high pressure pump. If the oil level is too low, add oil until the oil level is between the two markings on the oil measuring rod. Change the oil if it has a grey or whitish appearance. The oil should be disposed of responsibly.
- Check the water filter in front of the float valve in the water tank and the fuel filter in front of the solenoid valve. Clean the filters if necessary.

■ Yearly, or after approx. 500 hours of operation:

- Desulphurise and decarbonize the continuous-flow heater.
- Change the oil

■ Change the oil:

First oil change after approximately **50 operating hours**. Thereafter the oil should be changed every 500 operating hours or yearly.

Take the oil drainage hose, which is connected to the oil drainage screw from the inside of the appliance.

Open the red oil filler plug at the top side of the black oil housing.

Open the cap at the end of the hose. Drain off the oil into an oil pan and dispose of it responsibly. Close the end of the hose. Refill with new oil.

Oil leakage: If oil leaks out, go to the nearest customer service (dealer) immediately. (Environmental damages, transmission damages)

In case of increased humidity or fluctuations in temperature development of condensed water is possible; if the oil turns grey, you must change it at once.

■ Decalcifying the continuous-flow heater:

Calcified machines use an unnecessary amount of energy because the water can only be heated slowly and the excess pressure valve feeds a part of the water back into the pump circuit.

Calcified machines can be recognised by increased pipeline resistance.

Check pipeline resistance by disconnecting the high pressure lance from the gun and switching the machine on. A full jet of water emerges from the gun. The machine must be decalcified if the pressure shown on the manometer is greater than **25 bar**.

Proceed as follows to decalcify the machine:

1. Unscrew the high pressure hose from the machine and decalcify it separately.
2. Put the detergent suction hose into a container of decalcifying solution.
3. Set the detergent valve to the maximum concentration.
4. Switch on the machine.
5. Hold the gun in a separate container and press the trigger.
6. Wait for about a minute until the decalcifier comes out of the gun (recognisable by its whitish colour)
7. Switch off the machine and allow the solution to act for about 15-20 minutes.
8. Switch the machine back on and rinse with clear water for about 2 minutes.
9. Now check whether pipeline resistance is back to an acceptable level.

Repeat the decalcifying process if the pressure without the high pressure lance is still above 25 bars.

Decalcifiers are caustic!

Observe the instructions for usage and accident prevention. Wear protective clothing to prevent the decalcifying agent from contacting your skin, eyes and clothing (e.g. gloves, safety mask etc.)

Particular rules, directives and inspections

■ Inspections performed by Kränzle

- measurement of earth line resistance
- measurement of voltage and current
- inspection of tension consistency with +/- 1530 V
- pressure check of the heating units at 300 bar
- visual and functional check as per the inspection sheet provided

■ Guidelines for liquid sprayers

The machine conforms with the "Guidelines for liquid sprayers". These guidelines are issued by the organisation of trade associations and may be obtained from Carl Heymann-Verlag KG, Luxemburger Str. 49, 50939 Köln. These guidelines specify that this machine is to be inspected by qualified personnel whenever necessary, but no less than once every 12 months. These inspections must be recorded in the inspection log at the end of this manual.

■ Pressure container and steam boiler directives

Kränzle high pressure cleaning equipment conforms to the pressure container and steam boiler directive. No construction approval, notification of licence and takeover inspection are required. The water capacity is less than 5 l.

■ Duties of owner

The owner is to ensure that all safety-relevant components are in a serviceable condition before the sprayer is used. (e.g., safety valves, hose and electric cables, spray equipment etc).

24 Troubleshooting

Malfunction Cause of malfunction / remedy

Water supply

Water tank runs over.	Float valve is dirty or defect.
Water tank does not fill completely.	Float valve is defect. Water filter is dirty. Insufficient water inlet quantity.
Pump does not suck.	Valves stick or are dirty. Suction hose leaks. Chemistry valve is open or leaks. Check hose clips (connections). High-pressure nozzle is clogged.
Test: check water and chemical system for tightness.	Connect water inlet directly to the pump (2-8 bar pre-pressure). Disconnect suction lines below the pump

High-pressure pump

Pump makes loud noises. Operating pressure is not reached.	Pump sucks air. Check suction connections. Check high-pressure nozzle. Check valves. Check O-rings under valves. Check sleeves. Manometer is defect. Unloader: check stainless steel seat and ball. Check seals on the control piston.
Water drops from the pump.	Replace sleeves in the pump. Replace O-rings.
Oil drops from the transmission.	Check oil seals (replace). Check plunger and plunger guides. Check water supply, since water deficiency or air suction can cause damage to seals and O-rings (chemistry valve leaks?)
Pressure is too low.	Worn high pressure nozzle. Stainless steel seat, ball, O-ring in unloader is dirty or defect. Manometer is defect.

Machine does not switch off

	Check return body and O-ring in unloader of the valve housing.
Test: Bridge pressure switch (red)	Check pressure switch (red). Check micro switch. Check cable connections. Board is defect.

Appliance does not start or stops during operation

Check electricity supply. Check main switch. Check cable connections. Check board. Check pressure switch. Switch off by overcurrent release.

Malfunction Cause of malfunction / remedy

Machine does not start

Check electricity supply.
Check main switch.
Check cable connections.
Board defective.
Check pressure switch.
Switch off by overcurrent release.

Electrical heating elements

Insufficient water temperature.

Check electricity:
- ON-OFF - Switch
- Contactor
- Flow monitoring device

Leakage

Gun drips. High pressure hose drips.

Clean nozzle. Replace seals.
Replace O-ring below screwed connection.

Manometer indicates pressure, but no water comes out of HP-hose.

Clean nozzle.

Sucking detergent

Control knob leaking.

Replace seals.

Detergent is not sucked.

Pump sucks air. Check hose clips.

Test: Connect water line to the pump.
Water inlet: 2 - 8 bar pre-pressure. No water must come from the detergent hose.

26 Small repairs do it yourself

■ **No water from the nozzle but the gauge shows full pressure: Most likely the nozzle is blocked.**

(Inside the pressure gauge there is no water but a filling with glycol to damp the vibration of the pointer.)

Proceeding: Switch off the cleaner. Pull plug from the socket. Operate gun several times to decrease the pressure. First unscrew gun and lance, then rinse hose from any residues. Check water inlet filter for soiling. If the problem still exists, take wire (paper clip) and push cautiously through nozzle opening. If this procedure is not successful, the nozzle has to be dismantled and cleaned (from the backside) or even replaced, if necessary.

■ **Pressure gauge shows little pressure, the water from the nozzle comes in squirts, the high-pressure hose vibrates. Most likely the valves are soiled.**

Proceeding:
Unscrew all 6 valves, one after the other (hexagonal brass screws, 3 in a row, vertically and horizontally)

Take out valve body (with green or red plastic coating) and O-ring by means of needle nose pliers. Check O-ring for damage. In case of a damage the O-ring has to be replaced.

Take a wire (paper clip) and clean valves under running water. Also clean valve seating inside the pump.

Do not forget the O-ring during reassembly!

■ The pressure gauge shows full pressure although the gun has been closed. The pressure switch valve switches constantly.

Possible cause no.1: Leakage

Having closed the gun, the HP cleaner must shut down and the pressure gauge must show „0“ bar. If the pressure gauge still shows full pressure and the motor constantly switches on and off, the possible reason for this can be a leakage of the pump, the HP hose or the lance.

Proceeding:

Check the connections from the HP cleaner to the HP hose, from the hose to the gun and also the connection between lance and gun for tightness. Switch off the cleaner. Shortly press the trigger of the gun to decrease the pressure. Unscrew HP hose, gun and lance and check the O-rings. If the O-rings are damaged they have to be replaced.

In case of a leakage there is no guarantee for possible consequential damages.

Possible cause no. 2:

The non-return valve is soiled or defective

Proceeding:

Unscrew pump outlet.

Take out non-return valve body and check for soiling or damage of the O-ring.

Replace non-return valve if necessary.

There is no guarantee if the pump is damaged by defective O-rings due to air induction or lack of water (cavitation).

Pipeline plan

Safety valve, number 5 must be set approx. 15 % higher than the unloader valve on the HP pump

- 1 Float valve, water inlet
- 2 Water tank
- 3 Control valve, detergent
- 4 High pressure pump with integrated unloader valve
- 5 Safety valve for heating coil
- 6 Excess pressure line, safety valve
- 7 Flow monitoring device
- 8 Heating elements

Inspection report for HP cleaners

Inspection report on annually carried out Labour Safety Inspection (UVV) according to the Guidelines for Liquid Spray Equipment. (This inspection sheet serves as proof for the completion of the retest and must be kept carefully!) Kränzle-Test Stamp Mark: Order Number UVV200106

Owner: Type **therm**:

Address: Serial no.:

Rep.-order-no.:

Scope of inspection:	ok	yes	no	repaired
Type plate (on hand)				
Operating manual (on hand)				
Protective covering, -device				
Pressure line (tightness)				
Pressure gauge (function)				
Float valve (tightness)				
Spraying device (marking)				
HP-hose/ connector (damage, marking)				
Safety valve opens at 10% / 20% excess				
Pressure reservoir				
Heating oil line (tightness)				
Solenoid valve (function)				
Thermostat (function)				
Flow controller (function)				
Power cable (damage)				
Power plug (damage)				
Protective conductor (connected)				
Emergency Off Switch (function)				
On/Off-switch				
Water quantity safety device (function)				
Used chemicals				
Allowed chemicals				

Inspection data	determ. value	set value
High-pressure nozzle		
Operating pressurebar		
Cutting-off pressure.....bar		
Efficiency rating.....%		
Conductor resist. not exceeded / value:		
Insulation		
Leakage current:		
Gun locked		

Inspection result (tick)

- ☐ The appliance was checked by an expert according to the Guidelines for Liquid Spray Equipment, the defects found have been rectified so that the Labour Safety can be confirmed.
- ☐ The appliance was checked by an expert according to the Guidelines for Liquid Spray Equipment. The Labour Safety cannot be confirmed unless the defects found are rectified by repair or replacement of the faulty parts.

The next retest according to the Guidelines for Liquid Spray Equipment has to be carried out by: Month Year

Guarantee

■ The guarantee is only valid for material and manufacturing errors. Wearing does not fall within this guarantee.

The instructions in our operating manual must be complied with..
The operating instructions form part of the guarantee.

The guarantee period is **12 month** from date of purchase.

In the case of a guarantee please contact your dealer or authorized seller delivering accessories and your purchase receipt. You can find them in the internet under **www.kraenzle.com**.

The guarantee is also void if the machine is used with exceeding the temperature and speed limits, a voltage below the required rating, with less than the required amount of water or with dirty water.

Pressure gauge, nozzle, valves, sleeves, high pressure hose and spray equipment are wear parts and are not covered by the warranty.

Kränzle - world-wide:
Technical perfection at its best.
